Dynamic Behavior Analysis Of Crystal

The alignment behavior of a crystal with a magnetic anisotropy of $\chi_c < \chi_a$ under the imposition of a rotating magnetic field has been investigated by numerical calculation. The promotion of the crystal alignment when the projection of the magnetically hard axis on the magnetic field rotating plane is parallel to the magnetic field direction and its suppression when the magnetically hard axis is perpendicular to the magnetic

The dynamic behavior of a polymer-dispersed liquid crystal (PDLC) under an electric field has been studied by static and two-dimensional infrared spectroscopy. The PDLC sample was prepared by polymerization-induced phase separation of a mixture of nematic liquid crystal E7 and acrylate. 2D IR correlation analysis indicates that the rigid core of the liquid crystal molecules reorients as a unit, and suggests that the polymer side chain existing in the interface between the polymer and the ...

elastic continuum theory was developed and the relaxation times of nematic liquid crystals with CNTs were evaluated. Experiments made with single-walled carbon nanotubes dispersed in nematic 4-cyano-4'-pentylbiphenyl (5CB) indicated a significant difference of the relaxation time when compared to pure liquid crystal.

We considered the behavior of fast-moving circular cracks in an anisotropic material, single-crystal silicon. The crack-branching criterion used was the maximum-hoop stress. The fracture toughness on the $\{1\ 1\ 1\}$ planes was assumed uniform (i.e. $K_{Ic\{1\ 1\ 1\}} = 0.82$ MPa \sqrt{m}), while on the $\{1\ 1\ 0\}$ planes, it depended on the crack propagation direction.

The anisotropy exhibited by single-crystal silicon in nanometric cutting is very significant. In order to profoundly understand the effect of crystal anisotropy on cutting behaviors, a large-scale molecular dynamics model was conducted to simulate the nanometric cutting of single-crystal silicon in the (100)[0-10], (100)[0-1-1], (110)[-110], (110)[00-1], (111)[-101], and (111)[-12-1 ...

Although the experimental results appear to have the same behavior in the shock velocity vs. particle velocity plane, they are considerably different in the stress-volume compression plane and evidence is provided that indicates the single crystal remains crystalline up to the stresses imposed for this analysis.
