Raft Foundation Project Report

Raft foundations are one of the most appropriate foundation systems in order to prevent the differential settlement particularly when column loads are large and variable. The behavior of raft foundation is either rigid and/or flexible depending on the characteristics of the soil at which the foundation rests.

columns in one rigid body. In this project, the soil profile shows that the bearing stress is around 100 kN/m^2 . The raft foundation is usually used with this kind of soil. The columns have high axial loads.

Structural Design of Raft Foundation

Read PDF Raft Foundation Project Report

Raft foundation is a thick concrete slab reinforced with steel which covers the entire contact area of the structure like a thick floor. Sometimes area covered by raft may be greater than the contact area depending on the bearing capacity of the soil underneath.

foundation that is composed of a thick mat or slab that supports the entire structures. This type of foundation is used when there are larger column loads to support and when soil bearing capacity is too low. Raft foundations are suitable for medium rise story buildings ranges from four to twelve stories.
